

[Team QIK Racing HOME](#) (new)

Thoughts, Suggestions and Recommendations to keep your
Zer0-Mod Bandit Body
working well and damage free

- The Body is 3D printed and although it is durable, it will crack, break, and/or shatter if abused.
- Don't bash, there is no reason to have an OVAL or RACING body on your Bandit while just hammering on your race vehicle. If you want to "BASH" or screw around, put the original Bandit Body on while doing so. It only takes 2 body clips to do so.
- Don't race or practice with unlike vehicles. Other vehicles, larger, faster, slower, closed wheel, etc... may not care about crashing or protecting their investment, but you should care about protecting your investment.
- NO Off-Road. Off-Road or jumping causes chassis flex which puts unneeded and undesired stresses on the body. This is an OVAL body!
- Clean the Body with WATER ONLY. Chemicals, even "green stuff", can dry out the PLA material and cause it to be less durable. PLA is an easy to clean material that only needs water and a microfiber cloth to clean.
- Protect The Tank! The Tank is the most vulnerable part as rear collisions can easily ramp up on to the tank and cause damage. Protect the Tank by installing a Traxxas Wheelie Bar Mount, part number 3677, or the Team QIK Rear Bumper, depending on Body Model. They are inexpensive and will help protect the Tank and/or rear of the body.
- Race with Respect. With respect not only for your race car but for others' race cars as well. You're less likely to win going FAST but not CLEAN. Be patient, the other guy will eventually make room for you to pass and that will save both racers time on and off the track.
- Don't run or race the Zer0-Mod Bandit body while missing any parts. Each part plays an integral structural piece of the puzzle. The body is engineered to have ALL parts in place and properly mounted to give it the best feasible strength and durability. Nerf Bars and Exhaust Headers are especially beneficial and REQUIRED by rule.
